assistant and agentic systems for real-time production, research, or development.

While not all of these components may fit the same into every application, it’s useful to understand where and when to apply which component. In the next section, we look at how planning can be integrated into assistant/agentic systems.

11.5.1 Application of assistant/agentic planning

Planning is the component where an assistant or agent can plan to undertake a set of tasks, whether they are in series, parallel, or some other combination. We typically associate planning with tool use, and, rightfully, any system using tools will likely want a capable planner. However, not all systems are created equally, so in table 11.1, we’ll review where, when, and how to implement planners.
