evaluation in some agentic workflows, evaluation is often an external component in agentic systems. However, it's also a core component of most LLM applications and not something that should be overlooked in most developments. Table 11.3 describes at a high level how the evaluation component can be integrated with various LLM application types.

Table 11.3 When and where evaluation is employed and used in various applications

Application	Implemented	Environment	Purpose	Timing	Configuration
Personal assistant	External	Server	Determine how well the system is working	After the interaction	Often developed externally
Customer service bot	External monitor	Server	Evaluate the success of each interaction	After the interaction	External to the agent system
Autonomous agent	External or internal	Server or service	Determine the success of the system after or during task completion	After the interaction	External or internal
Collaborative workflows	External	Shared canvas or coding	Evaluate the success of the collaboration	After the interaction	External service
Game AI	External or internal	Server or application	Evaluate the agent or evaluate the success of a strategy or action	After the interaction	External or as part of the agent or another agent
Research	Combined manual and LLM	Server and human	Evaluate the output of the research developed	After the generated output	Depends on the complexity of the problem and research undertaken

Table 11.3 shows several varied application scenarios in which we may find an assistant or agent deployed to assist in some capacity. To provide further information and guidance, this list provides more details about how evaluation may be employed in each application:
