

Dataset Description

The dataset used for this example contains three features:

- **Age:** The age of the customer.
- **Annual Income:** The yearly income of the customer in thousands of dollars.
- **Spending Score:** A score assigned to customers based on their spending habits and behavior (ranging from 1 to 100).

Objective

The goal is to identify meaningful customer segments to enable targeted marketing strategies, such as identifying high-spending customers or value-seeking customers.

Implementation in Python

Below is the step-by-step implementation of customer segmentation using K-Means clustering:
