Figure 3.2 Direction of messages between the manager and the workers

Typically, you produce messages not at the app level, as in this example, but rather through endpoints like HTTP, gRPC, or something similar. How you create these entry points is covered in chapter 11. For now, we don't get into how to connect to an Akka app from the outside. Instead, we focus on the app itself.

NOTE The examples for this section can be found in the `errorkernel` package.

3.1.1 Coding the app

To see how to implement figure 3.2, let's start at the top of the hierarchy (the guardian) with the input sent from the app to the guardian. The guardian's protocol is as follows:

```
object Guardian {

  sealed trait Command
  final case class Start(texts: List[String]) extends Command

  ...
}
```

`Start` contains the texts to parse, and it's used like this:

```
object ErrorKernelApp extends App {

  val guardian: ActorSystem[Guardian.Command] =
    ActorSystem(Guardian(), "error-kernel")
  Guardian ! Guardian.Start(List("-one-", "--two--"))   ❶
}
```
