3.1.2 Coding the guardian and spawning

The following listing shows how the guardian creates the manager and delegates tasks to it.

Listing 3.1 Guardian

```
import akka.actor.typed.scaladsl.Behaviors
import akka.actor.typed.{ ActorRef, ActorSystem, Behavior }

object Guardian {

  sealed trait Command
  final case class Start(texts: List[String]) extends Command    ❶

  def apply(): Behavior[Command] =
    Behaviors.setup { context =>
      context.log.info("Setting up. Creating manager")
      val manager: ActorRef[Manager.Command] =
        context.spawn(Manager(), "manager-alpha")              ❷
      Behaviors.receiveMessage {
        case Start(texts) =>                                   ❸
          manager ! Manager.Delegate(texts)                    ❹
          Behaviors.same
      }
    }
}
```

❶ Form input

❷ Creates an actor inside an actor

❸ Texts input

❹ Delegates texts to the manager

Once the guardian and manager are created, the guardian can start processing messages. They are processed with the method `Behaviors.receiveMessage`, where the guardian delegates to the manager the test contained in `Start`. It wraps them in a `Delegate` message that the manager can understand and sends them with `tell` (that is, `!`). Next, let's look at the manager.
