worker for each text, and then asks each worker to parse the text. Finally, depending on whether the answer arrives on time, the manager creates a report of success or failure.

3.2.5 Coding the worker

The worker does the following:

1. When it is created, it receives the file that it must process.
2. After receiving `Parse` and the reference to which it should respond, it starts parsing the file. The parsing is a pseudo-parse whose only purpose is to introduce the duration. Once the worker is done, it responds with `Done`.

    - The fake parsing takes between 2 and 4 seconds to finish. This relates to the manager's timeout time of 3 seconds, so on average, half the requests time out.

The code for the worker is shown in the following listing.

Listing 3.5 Worker

```
object Worker {

  sealed trait Command                                                          ❶
  final case class Parse(replyTo: ActorRef[Worker.Response]) extends Command   ❶

  sealed trait Response                                                         ❶
  final case object Done extends Response                                       ❶

  def apply(text: String): Behavior[Command] =                                  ❷
    Behaviors.receive { (context, message) =>
      message match {
        case Parse(replyTo) =>
          fakeLengthyParsing(file)                                              ❸
          context.log.info(s"${context.self.path.name}: done")                  ❹
```
