```
ActorRef[Worker.Response] => Worker.Parse("text-a", replyTo)
```

Once you have added this function to your manager, you can change the previous creation of the worker, shown again here:

```
package simplequestion

object Manager {
  ...

  val worker: ActorRef[Worker.Command] =
    context.spawn(Worker(text), s"worker-$text")     ❶
  context.ask(worker, Worker.Parse){
  ...
}
```

❶ Passes the text on creation

Change it to the following implementation:

```
object Manager {
  ...

  val worker: ActorRef[Worker.Command] =
    context.spawn(Worker(), s"worker-$text")
  context.ask(worker, auxCreateRequest(text)){    ❶
  ...
}
```

❶ Passes the text on ask

This change from passing `Worker.Parse` directly to creating `auxCreateRequest` and passing that curried function to the `ask` is what you need to enable passing a payload. With this, you have learned how to include a payload when asking an actor.

Summary
