```
    "spawning takes place" in {
      val testKit = BehaviorTestKit(SimplifiedManager())
      testKit.expectEffect(NoEffects)                                  ❶
      testKit.run(SimplifiedManager.CreateChild("adan"))               ❷
      testKit.expectEffect(Spawned(SimplifiedWorker(), "adan"))        ❸
    }
  }
}
```

❶ Empty list of effects

❷ Sends a CreateChild message to the manager

❸ Checks the effect

You can run this test—along with the code in the rest of the section—by executing the following command in the repository's root directory:

```
sbt "chapter04/testOnly *SyncTestingSpec"
```

This test outputs the following:

```
[info] SyncTestingSpec:
[info] Typed actor synchronous testing
[info] - must record spawning
```

You can see how this output corresponds to the code defining the test:

```
class SyncTestingSpec ...

  "Typed actor synchronous testing" must {

    "record spawning" in {...}

  ...
}
```

NOTE This definition of the test is not Akka-specific. It corresponds to the ScalaTest semantics.
