```
        case Resume =>
          context.log.info(s"resuming")
          resume(count)
  }}}
}
```

❶ You get a resume t seconds after the Pause message.

Now you can test that you get a resume message by using the fishing capabilities of the probe in the `ActorTestKit`. This works as follows.

You must develop a strategy for each possible message the probe encounters during the test. During this time, you can explicitly stop fishing—because the probe receives the expected message—or let the time run out until the test fails. There are four strategies for fishing for messages (figure 4.3):

- Keep the message and complete the testing.
- Keep the message and continue testing.
- Discard the message and continue testing.
- Disregard any previous catches and fail.

If you complete the test without it failing, you can use the messages the probe received and assert on them. Figure 4.3 describes these strategies. Note that the message types are fictitious.
