- The expectation
- The trigger that causes logging

For example, you can set the expectation to catch “it’s done” in the logs and trigger it by sending a `Log` message to the simplified manager:

```
class AsyncLogSpec ...
  ...

  LoggingTestKit.info("it's done").expect {
        manager ! SimplifiedManager.Log
  }
  ...
}
```

The entire test is shown in the next listing.

Listing 4.5 Using `LoggingTestKit` and `ScalaTestWithActorTestKit`

```
import akka.actor.testkit.typed.scaladsl.ScalaTestWithActorTestKit
import akka.actor.testkit.typed.scaladsl.LoggingTestKit

class AsyncLogSpec
    extends ScalaTestWithActorTestKit                                  ❶
    with AnyWordSpecLike
    with Matchers {

  "a Simplified Manager" must {

    "be able to log 'it's done'" in {
      val manager = testKit.spawn(SimplifiedManager(), "manager")      ❷

      LoggingTestKit.info("it's done").expect {                        ❸
        manager ! SimplifiedManager.Log                                ❹
      }
    }
  }
}
```
