processing logic and no error handling or fault recovery logic, so it’s effectively independent of the recovery process, which keeps things much clearer. The mailbox for a failing actor is suspended until the supervising behavior in the recovery flow has decided what to do with the exception. Messages can still be sent to the mailbox, but they will be stashed.

Figure 5.6 shows a supervisor behavior that takes care of only the recovery actions and an actor that takes care of the domain logic. The two can be mixed by wrapping the actor behavior in the supervisor behavior.
