decide not to handle the signal, you implicitly associate the monitored actor's termination/failure event with the monitoring actor's strategy, allowing the exception to bubble up.

5.5 Back to the initial use case

With all these ideas and techniques for monitoring and supervision, let's return to the previous log-processing application. We look at two possible designs for this application and an implementation sketch.

5.5.1 Supervisor hierarchy initial design

In this first design, the initial actor, the guardian—called `LogProcessingGuardian`—creates all the actors in the application and connects them directly to each other via `ActorRef`s. This is shown in figure 5.11.

NOTE The classes and objects for this section can be found in the `faulttolerance1` package.
