or listing in the .scala file with the same name as the class, object, or trait.

6.1 Discovery: The receptionist

The receptionist is an extension, meaning it is a class with only one instance in the `ActorSystem`. The receptionist is the mechanism that allows actors to register for a specific key so that any actor can request notifications for that key. For the key, you need to define the `ServiceKey`; and to request notifications, you need the `context.system.receptionist.Receptionist`.

Let's say you have an application that lets you register customers in a hotel, and you want to inform the hotel concierges about high-end registrations so they can prepare for VIP clients. This is implemented with a `HotelConcierge` actor subscribing to a key called `goldenKey`. VIP guests register for this key when they reach the hotel, and the subscribed `HotelConcierge` receives the list of registered guests and—to simplify the example—prints in the console only the guest's name.

The concierge `goldenKey` is a `ServiceKey`. This is a kind of key specific to the receptionist API, and it needs a name (`concierge-key`), as you can see in the following snippet. This name, in combination with its type, makes the service key unique. That is, two service keys with the same type but different names are two different keys for the receptionist:

```
import akka.actor.typed.receptionist.ServiceKey
...
object HotelConcierge {
```
