causes the pool router to reduce its performance. The pool router creates the routees but cannot recover them after a failure.

6.3.2 Changing strategies

The default strategy of a pool is round-robin. To change to a random strategy, add `withRandomRouting()`:

```
val routingBehavior: PoolRouter[String] =
      Routers
        .pool(poolSize = poolSize)(behavior)
        .withRandomRouting()                    ❶
```

❶ Strategy setting

To select broadcasting, for example, for messages of a certain importance, you need the following:

```
val routingBehavior: PoolRouter[String] =
      Routers
        .pool(poolSize = poolSize)(behavior)
        .withBroadcastPredicate(violation => violation.level > 5)    ❶
```

❶ Strategy selection

This can be used by the data checker when it detects a serious violation by a driver that you want to broadcast to all highway patrol officers.

Instead of filtering by a property of the message content, you can also filter by the message type, provided there is a behavior like the following:

```
object HighWayPatrol {
  sealed trait Command
  final case class Violation(plateNumber: String) extends Command      ❶
```
