```
  final case class WithinLimits(plateNumber: String) extends Command   ❶

  ...
}
```

❶ Protocol

You can broadcast each violation message to all patrol officers as follows:

```
object BroadcastingChecker {
   ...
   val dataCheckerRouter: PoolRouter[HighWayPatrol.Command] =
        Routers
          .pool(poolSize = 4)(behavior)
          .withBroadcastPredicate(msg =>
            msg.isInstanceOf[HighWayPatrol.Violation])    ❶

   ...
}
```

❶ Message type filter

Pool routers are easy to use, but sometimes they are too limiting and you want more flexibility and control over when and where routees are created. The alternative is to create the routees yourself and assign them to a group router.

6.3.3 Akka group router

A group router is (in some ways) the same as a pool router. It forwards messages to the routees just like a pool router does. The difference lies in the relation with its routees: you instantiate the routees outside the router and register them to the receptionist with a service key. Then, to create a group router, you only need to use the routees' service key. This way, the router can find the routees via the
