state-based router. We explored both ideas previously in chapters 2 and 3.

6.4.1 Content-based routing

The most common routing pattern in a system is based on the messages. In the speed limit ticket example, you saw a message-based router. If the traveler's speed is below the speed limit, the photo is not needed and is deleted; but if the speed is higher, it is a violation, and processing should continue to alert highway patrol (figure 6.8).
