```
MyAppl {
  version = 10
  description = "My application"
}
subApplA {
  MyAppl {                          ❶
    description = "Sub application"
  }
}
```

❶ By lifting this, you get a shared property (version) and override description.

Here, you can lift the subtree within `subApplA` of the configuration to put it in front of the configuration chain. Figure 7.4 shows this lifting.

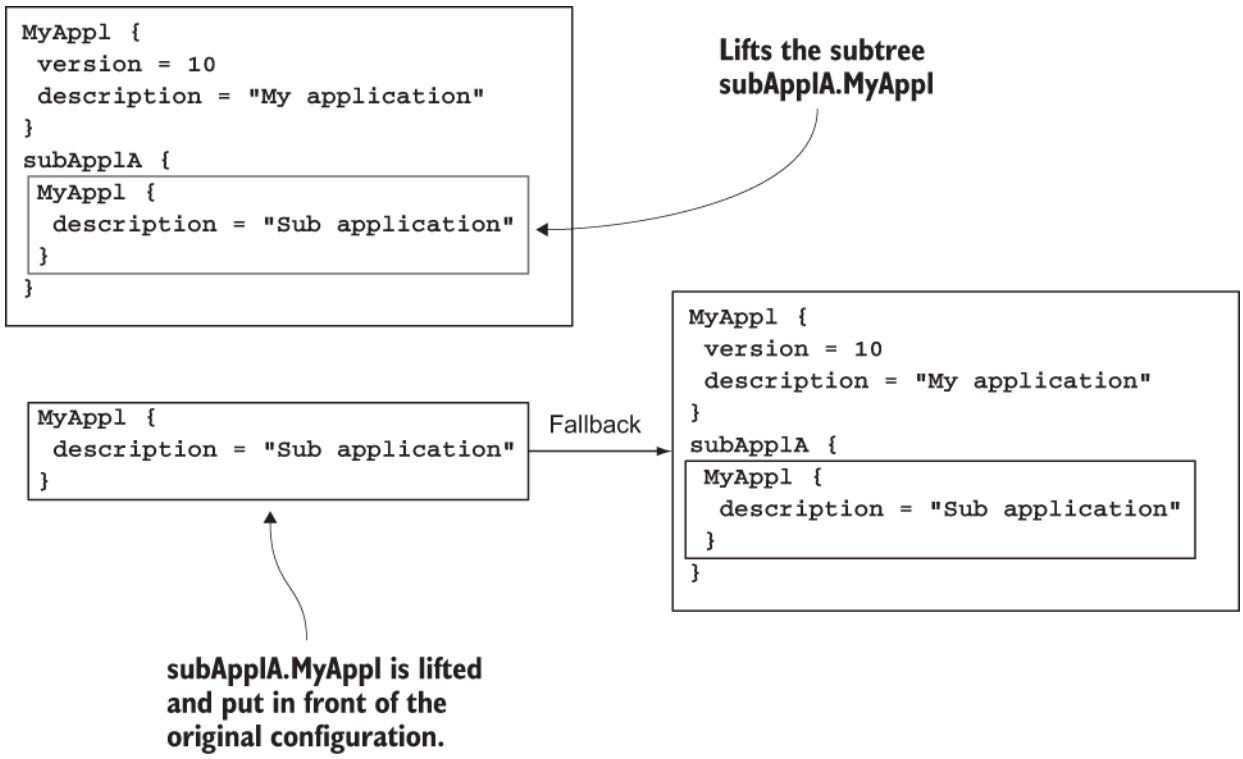

Figure 7.4 Lifting a configuration section

The next snippet shows how to do this. Load the configuration to have both the lift and the fallback. Note that the fallback is chained
