```
    with Matchers {

  "Actor" must {

    "lift one property from conf" in {
      val inmemory = testKit.system.settings.config                    ❸
      val journalenabled =                                             ❸
        inmemory.getString("akka.eventsourced-entity.journal-enabled") ❸
      val readjournal =                                                ❸
        inmemory.getString("akka.eventsourced-entity.read-journal")    ❸

      val loggerBehavior: Behavior[String] = Behaviors.receive {       ❹
        (context, message) =>
          message match {
            case message: String =>
              context.log.info(s"$journalenabled $readjournal")
              Behaviors.same
          }
      }

      val loggerActor = spawn(loggerBehavior)
      val message = "anymessage"

      LoggingTestKit
        .info("false inmem-read-journal")                              ❺
        .expect {
          loggerActor.ref ! message
        }
}}}
```

❶ Lifts the configuration

❷ Falls back to the configuration in-memory.conf

❸ Retrieves values from the configuration

❹ Actor that only logs

❺ Proves that only journal-enabled has changed

The `journal-enabled` value is overwritten in the test, while `read-journal` remains the same. You can run this test by executing the following at the command line:

```
sbt chapter07/test
```
