8.2 Why use clustering?

A *cluster* is a dynamic group of nodes. On each node, an `ActorSystem` listens on the network. Clusters build on top of the `akka-remote` module, making location transparency possible in Akka. Whether an actor is in the same node or not, its location is abstracted, so it's transparent to deal with an actor despite its residence. Your code, the business logic, doesn't have to concern itself with this. Figure 8.1 shows a cluster of four nodes.
