The previous configuration is in the book's Git repository in a project called chapter08a. Begin there with the sbt console so you have all the dependencies in place, and set the `PORT` variable used in the configuration file to 2551:

```
sbt -DPORT=2551 chapter08a/console
```

This produces the following output:

```
[info] Loading settings for project global-plugins from build.sbt ...
...
Type in expressions for evaluation. Or try :help.
scala>                                                    ❶
```

❶ REPL where you can write Scala code

From here, you need to create the `ActorSystem`. The easiest way is to paste the following in the console. Enter `:paste` and then copy the test:

```
scala> :paste
// Entering paste mode (ctrl-D to finish)
import akka.actor.typed.ActorSystem
import akka.actor.typed.scaladsl.Behaviors

 val guardian = ActorSystem(Behaviors.empty, "words")     ❶
```

❶ Starts the ActorSystem with the previous configuration

`Behaviors.empty` is enough to create the actor. As soon as you press Ctrl-D, you exit the insert mode, and the console interprets the code. The following listing shows the most important messages from the output of this execution.

Listing 8.2 Output of sbt
