```
➥version [0.0.0]                                                    ❷
Cluster Node [akka://words@127.0.0.1:2551] - Leader is moving node
➥[akka://words@127.0.0.1:2552] to [Up]                              ❸

       ...                                                           ❹
```

❶ Welcomes the = new node on port 2552

❷ Initial node status

❸ Seed node 2 joins

❹ Equivalent console output for the node on port 2553

Seed nodes 2 and 3 both request to join the cluster. The leader puts them in the `Joining` state and them into the `Up` state, making them part of the cluster. All three seed nodes have now successfully joined the cluster.

Figure 8.7 shows the different states of a node in the cluster, also known as the node's *lifecycle*. These states can be changed by leader actions or cluster commands. The system triggers the leader actions automatically, but you can also send `ClusterCommand` messages to the cluster, as discussed in the next section.
