❷ List of members

❸ Flagged as unreachable

If `akka.management.http.route-providers-read-only` is set to `false`, you can force the node on port 2552 to leave by requesting

```
curl -XDELETE localhost:8558/cluster/members/akka://words@127.0.0.1:2552
```

The response is `{"message":"Leaving akka://words@127.0.0.1:2552"}`.

8.3.1 Cluster subscriptions

Another way to check the status of the cluster is subscription. Instead of making a synchronous HTTP call to the `akka-management-cluster` HTTP module, you can be notified with `ClusterDomainEvent` messages. You can subscribe an actor to these cluster events using the `subscriptions` method on the `akka.cluster.typed .Cluster`.

The word-counting application shows how the guardian subscribes to the cluster domain events to verify that the application is `Up` and ensure a minimum number of nodes in the cluster to which it can hand off work. You don't want to start processing text if there are no workers to do the counting. But before we get to that, let's look at how an actor can subscribe to lifecycle events and be notified.

NOTE The source code for the following example is available at www.manning.com/books/akka-in-action-second-edition or https://github.com/franciscolopezsancho/akka-
