❸ Creates an HttpResponse via the complete method

The last entry in this example is similar to the first, where there is no explicit `HttpResponse`. You can rely on Akka HTTP to do this with the default values `200 OK` and content type `text/plain; charset=UTF-8`.

Traversing the route

To traverse the directives of a path—when processing a request—Akka HTTP can *reject* a directive if it doesn't match the request and try with the remaining directives. So far, you've only seen one directive, so there wasn't much choice; let's add another.

To add a directive, you can use the tilde (`~`) operator, which adds a `post` to the previous path:

```
val route: Route =
  path("ping") {
    get {
      complete("pong")
    } ~                              ❶
    post {                           ❷
      println("fake storing op")
      complete("ping stored")
    }
  }
```

❶ Concatenates the two routes

❷ Second directive to try if the first is rejected

If you call a service with such a route with curl localhost:8080/ping -XPOST, the first directive (`get`) is tried and rejected because it does not match the call. Then `post` follows, which matches the request and processes the call.
