```
          get {complete("I'm path(a/b) -XGET")},
          post {complete("I'm path(a/b) -XPOST")}
        )
      },
      path("e"){
          get {complete("I'm path(a/e) -XGET")}
      }
    )
  }
```

You can try this by executing from the root of the repository:

```
$ sbt chapter11a/run
```

Pick option [2], `example.http.HttpServerConcat`, and send a `GET` command to `/ping` with the command line

```
$ curl localhost:8080/ping
```

Or send a `POST`:

```
$ curl  localhost:8080/ping -XPOST
```

Failing

Routes can fail when processing requests, and you can catch their exceptions with an `ExceptionHandler`. Exceptions rise from the inner paths to the outer paths until an `ExceptionHandler` catches them. If an exception reaches the top path without being explicitly handled, a default `ExceptionHandler` catches it, and the client gets the usual cryptic message “There was an internal server error at 500 HTTP.” Not ideal. At any point in the processing of the request, you can also throw an exception with the directive
