```
      handleExceptions(exceptionHandler) {          ❸
        path("imfeelinglucky") {                    ❹
          get {
            complete(
              HttpEntity(
                ContentTypes.`application/json`,
                "exactly the site you wanted " +
                   (Random.nextInt / Random.nextInt(2))))
  }}
  ...
}
```

❶ Defines an exception handler

❷ Extracts the URI with a directive

❸ Adds an exception handler to the directive

❹ Generates a random response

You can try this by executing from the root of the repositor:

```
$ sbt chapter11a/run
```

Choose option [3], `example.http.HttpServerExceptions`, and send a `GET` command to `/imfeelinglucky` from the command line:

```
$ curl localhost:8080/imfeelinglucky
```

If you keep trying your luck, you will get an exception sooner rather than later.

11.1.5 Marshalling and unmarshalling

Marshalling is a loose synonym for serialization. It is commonly used in the context of remote procedure calls (RPCs). Typically, marshalling is part of a whole where there is communication between a client and a server.
