`ActorSystem`.

11.1.6 Akka HTTP communicating with actors

Let’s continue with the example from chapter 10 but without persistence, only sharding. You can add cargo to the following container and query how much cargo it has.

Listing 11.3 Domain object

```
object Container {

  val typeKey = EntityTypeKey[Command]("container")                    ❶

  final case class Cargo(kind: String, size: Int)                      ❷
  final case class Cargos(cargos: List[Cargo])                         ❷

  sealed trait Command
  final case class AddCargo(cargo: Cargo)
      extends Command                                                  ❸
  final case class GetCargos(replyTo: ActorRef[Cargos]) extends Command ❸

  def apply(
      entityId: String,
      cargos: List[Cargo] = Nil): Behavior[Command] = {                ❹
    Behaviors.receive { (context, message) =>
      message match {
        case AddCargo(cargo, replyTo) =>                               ❺
          println(s"adding cargo $cargo")
          apply(cargo +: cargos)
        case GetCargos(replyTo) =>                                     ❻
          replyTo ! Cargos(cargos)
          Behaviors.same
      }
    }
  }
}
```
