`AddedCargo`, and the gRPC service called `ContainerService`. This .proto file must be in the proto folder inside the src folder (for example, src/main/proto/container.proto).

Listing 11.5 .proto file

```
syntax = "proto3";                                          ❶

option java_package = "example.container.grpc";             ❷
option java_outer_classname = "ContainerProto";             ❸

message Cargo {                                             ❹
      string kind = 1;
      int32 size = 2;
}
message AddedCargo {                                        ❹
      bool ok = 1;
}
service ContainerService {                                  ❺

      rpc AddCargo (Cargo) returns (AddedCargo) {}          ❻
}
```

❶ Mandatory field to signal that this is a .proto file

❷ Package of the generated classes

❸ Java class containing the implementation of this protobuf

❹ Data structures to be used as inputs and outputs

❺ Service definition

❻ RPC call

The string fields are converted to `String`, int32 to `Int`, and bool to `Boolean`. The `java_package` option sets the package in each of the generated classes, and `java_outer_classname` forces the `messages` to be implemented under this class.

Note that there is no trace of Akka in the definition of this file. This is the abstraction that gRPC provides. Once this file is present and the
