```
  final case class Odds(winHome: Double, winAway: Double, draw: Double)
      extends CborSerializable
  ...
}
```

A market can be requested to be opened, updated, closed, or canceled. And, of course, you can check its status.

Listing 12.4 Market commands

```
object Market {
  ...

  sealed trait Command extends CborSerializable {
    def replyTo: ActorRef[Response]
  }
  final case class Open(
      fixture: Fixture,
      odds: Odds,
      opensAt: OffsetDateTime,
      replyTo: ActorRef[Response])
      extends Command

  final case class Update(
      odds: Option[Odds],
      opensAt: Option[OffsetDateTime],
      result: Option[Int], //1 =  winHome, 2 = winAway, 0 = draw
      replyTo: ActorRef[Response])
      extends Command

  final case class Close(replyTo: ActorRef[Response]) extends Command

  final case class Cancel(reason: String, replyTo: ActorRef[Response])
      extends Command
  final case class GetState(replyTo: ActorRef[Response]) extends Command
  ...
}
```

`Cancel` stops the market and makes it unavailable for betting. `Close` registers the normal end of the event, whereas `Cancel` does not; therefore `Cancel` has a `reason` field.
