```
      "lifespan",
      ValidationsTimedOut(10),
      10.seconds)
    val open = Opened(                                              ❷
      state.status.betId,
      command.walletId,
      command.marketId,
      command.odds,
      command.stake,
      command.result)
    Effect
      .persist(open)                                                ❸
      .thenRun((_: State) =>
        requestMarketStatus(command, sharding, context)             ❹
      .thenRun((_: State) =>
        requestFundsReservation(command, sharding, context))        ❺
      .thenReply(command.replyTo)(_ => Accepted)                    ❻
  }
  ...
}
```

❶ Starts a timer to validate the bet state

❷ Creates the Opened event

❸ Persists the event

❹ Request to verify that the odds are still available

❺ Request to reserve the funds to the wallet

❻ Responds to the caller

Remember that saving the `Opened` event does not mean the entity has executed any of the requests or even the response: that is, `thenRun` or `thenReply`. The JVM may fail immediately after persisting.

NOTE If that is the case, the timer will no longer be present when the entity respawns. Fortunately, this is not a problem. If the validations are not triggered, the initial value for `marketConfirmed` and `fundsReserved` is `None`, which can be interpreted as “not true” when the bet is settled.
