12.2 The ports

Let’s create some ports that act as entry points to these actors. You can use Akka gRPC to provide an order guarantee when you update the market and the bet, which happens frequently. Creating a stream with gRPC gives you these features as opposed to a unary call or a normal HTTP call to Akka HTTP. gRPC also allows you to query the service via reflection to see the list of available calls, which is convenient.

Akka HTTP is easy to implement, and you can do that for the wallet for simplicity. You know how to handle ports, so this section is more about the business logic than anything else. The market port is shown here, and the rest are in the repository.

12.2.1 The market

The gRPC .proto for the market actor includes the equivalent of each `ReplyCommand` of the market: `Open`, `Update`, `CloseMarket`, `Cancel`, and `GetState`.

Listing 12.13 Protobuf file for the market

```
message FixtureData {                    ❶
       string id = 1;
       string homeTeam = 2;
       string awayTeam = 3;
}

message OddsData {                       ❶
      double winHome = 1;
      double winAway = 2;
      double tie = 3;
}
```
