In chapter 8, the configuration referenced a specific host and port, but here you reference the `discovery` method. You have only two initial nodes that match the default `contact-point-discovery.required-contact-point-nr = 2` specified in the `akka-management-cluster-bootstrap` module's reference.conf. It is recommended that you set this number to the number of nodes intended to form the initial cluster.

Listing 13.1 Configuration with fixed IPs

```
akka {
      actor.provider = cluster                                    ❶

      discovery {
               config.services = {
                  testing-bootstrap = {                           ❷
                        endpoints = [                             ❸
                        {
                              host = "127.0.0.1"
                              port = 8558
                              },
                        {
                              host = "127.0.0.2"
                              port = 8558
                        }
                        ]
                  }
               }
      }

      management {
               cluster.bootstrap {
                  contact-point-discovery {
                        service-name = "testing-bootstrap"        ❹
                        discovery-method = config                 ❺
               }
      }
}
```
