Version `0.1.0-SNAPSHOT` is the project version specified in the build.sbt file. Once it's created, this Docker image is in the local Docker repository on your computer.

Normally, you need to push this image to an external repository that Kubernetes can reach and create the pods from it. To push the image, you must first tag it with the name of the registry you want to upload it to. If nothing is specified, the default is https://hub.docker.com/. To use the default, log in to this registry from the command line by entering

```
docker login
```

Once you have specified the user and password, you can push the image after tagging it with the repository as follows:

```
$ docker tag chapter13b:0.1.0-SNAPSHOT \
yourrepositoryhere/chapter13b:0.1.0-SNAPSHOT                ❶

$ docker push yourrepositoryhere/chapter13b:0.1.0-SNAPSHOT  ❷
```

❶ Tags the image to the yourrepositoryhere repository

❷ Pushes to docker.io hub (that is, hub.docker.com)

To deploy to Kubernetes, you need the following:

- A Kubernetes `Deployment`
- A Kubernetes `Role` and a `RoleBinding`
- A Kubernetes `ServiceAccount`
- A Kubernetes server
