Listing 13.4 Setting probes for readiness and liveness

```
spec:
...
  template:
    metadata:
...
    spec:
      containers:
      - name: testing-bootstrap13b
...
        livenessProbe:
          httpGet:
            path: /alive                ❶
            port: management
        readinessProbe:
          httpGet:
            path: /ready                ❷
            port: management
        ports:
        - name: management              ❸
          containerPort: 8558           ❹
          protocol: TCP
```

❶ Akka Management path for checking liveness

❷ Akka Management path for checking readiness

❸ Names the port used

❹ Akka Management port defined in the application.conf file

In this part of the deployment, you reference the paths of the two probes—`alive` and `ready`—available through the Akka Management module configured via the `akka.manangement.http` settings in application.conf and started with `AkkaManagement(system).start()`. This is enough to set the deployment, but you may want a few extras.

13.2.3 Optional: Setting Java options
