It is often necessary to pass Java options to your application: for example, to set the memory. To do so, you can use the `JavaAppPlugin` from `sbt-native-packager`. Among other parameters, it accepts `JAVA_OPTS`, which you can set in the deployment.yml file as follows:

```
apiVersion: apps/v1
kind: Deployment
...
spec:
...
  template:
...
    spec:
      containers:
      - name: testing-bootstrap13b
...
        env:
        - name: JAVA_OPTS
          value: "-Xmx1024m"     ❶
```

❶ Sets the maximum size of the memory allocation pool in bytes

The analysis of the deployment is divided into many parts. Let's look at the entire file to get a good overview of what you have seen so far in this section.

Listing 13.5 Deployment in the deployment.yml file

```
apiVersion: apps/v1
kind: Deployment
metadata:
  labels:
    app: testing-bootstrap13bxyz
  name: testing-bootstrap13b
spec:
  replicas: 3
  selector:
    matchLabels:
     app: testing-bootstrap13b-env                    ❶
  strategy:
    rollingUpdate:
