- Add a Kubernetes role, a service account, and a role binding so the deployment has the required permissions to find the pods in the Kubernetes cluster.
- Avoid shutting down the nodes during network partitioning, but rely on the Split Brain Resolver to help the cluster to maintain a consistent state.
- You can configure the SBR to `keep-majority`, `lease-majority`, `static-quorum`, or `keep-oldest`.
- You can create an actor and make sure there is only one instance in the entire cluster with Akka Singleton.
