This sets the commit every 100 records or after 10 seconds if fewer than 100 have been processed in that time. You can get the `committerSettings` directly from the `system` as follows:

```
import akka.kafka.CommitterSettings

object ConsumerCommittableSource {
  ...

  val committerSettings = CommitterSettings(system)
  ...
}
```

You can use the offset from the `CommittableMessage` in the `Committer.flow`, as you can see in its signature:

```
package akka.kafka.scaladsl

object Committer {
  ...

  def flow(settings: CommitterSettings): Flow[Committable, Done, NotUsed]
  ...

}
```

Since this is `a flow[Committable, Done, NotUsed]`, you need input elements of type `Committable`, like `CommittableOffset`. The output is of type `Done`, and it doesn't have a materialized value and thus is `NotUsed`. To the `flow`, you can pass the following settings:

- `maxBatch`—Maximum number of messages in a single commit. Default: 1000.
