14.2 Pushing to Kafka

In most streaming applications, you need to read from Kafka, but you also need to write to it. The classic case is ETL (extract, transform, load).

14.2.1 At-most-once delivery guarantee

You can push to Kafka with a `ProducerRecord` and a `plainSink`. The `ProducerRecord` needs the element to push along with the topic name, and the `plainSink` needs the properties of the Kafka configuration. This is similar to the consumer settings, as you can see:

```
class KafkaSpec ... {

  ...

  Source(1 to 10)
   .map(_.toString)
   .map(elem => new ProducerRecord[String, String]("test", elem))
   .runWith(Producer.plainSink(producerSettings))
  ...
}
```

The producer settings set the serializers instead of the deserializers you saw in the consumer. That's not a surprise now that you're writing. The producer settings also set the bootstrap server URL. Here is one for simplicity:

```
class KafkaSpec ... {
  ...

  val producerSettings =
       ProducerSettings(
         config,
```
