You need to configure the application. You can create a configuration to run it locally or in Kubernetes. The betting-house project includes local.conf and application.conf files for these two environments.

15.2.1 Persistence

The configurations are almost identical when it comes to persistence. Here you need to specify the persistence plugins—journal and snapshot store—for the entities to be persisted. To do this, specify which database you want them to read from and write to.

Listing 15.8 `akka.persistence` local configuration

```
akka {
  ...
  persistence {                                    ❶
    journal.plugin = "jdbc-journal"
    auto-start-journals = ["jdbc-journal"]

    snapshot-store.plugin = "jdbc-snapshot-store"
    auto-start-snapshot-stores = ["jdbc-snapshot-store"]
  }
}
...
jdbc-connection-settings {                         ❷
  driver = "org.postgresql.Driver"
  url = "jdbc:postgresql://127.0.0.1:5432/betting"
  user = betting
  password = betting

  ...
}

akka-persistence-jdbc {
  shared-databases {
    default {                                      ❸
      profile = "slick.jdbc.PostgresProfile$"
      db {
        host = "localhost"
        url = ${jdbc-connection-settings.url}
        user = ${jdbc-connection-settings.user}
        password = ${jdbc-connection-settings.password}
```
