```
        driver = ${jdbc-connection-settings.driver}
        numThreads = 5
        maxConnections = 5
        minConnections = 1
      }
    }
  }
}

jdbc-journal {                                  ❹
  use-shared-db = "default"
}

jdbc-snapshot-store {                           ❺
  use-shared-db = "default"
}

jdbc-read-journal {                             ❻
  use-shared-db = "default"
}
```

❸ Database connection details

❹ Links the event_journal table for writes to the default connection details

❺ Links the snapshot table to the default connection details

❻ Links the event_journal table for reads to the default connection details

You may have noticed that the URL contains 127.0.0.1. This is local.conf. In application.conf, you have `postgres-betting-db` instead. You'll see why in section 15.3.2.

To write the events, create the corresponding tables: `event_journal`, `snapshots`, and `event_tags`. The latter correlates tags and entity IDs so that entities can be grouped when queried. Regardless of whether you are working locally or in Kubernetes, you must run the SQL from the akka-persistence.sql file to create the three tables. For detailed instructions, see sections 15.3.1 and 15.3.2.
