15.2.2 Cluster local

On local, specify the settings for `remote` and `cluster`. You need to ensure that the port in the seed nodes matches the `canonical.port` in the configuration, at least in one node. Otherwise, no cluster can be formed.

Local and Kubernetes deployments have common configurations: `serialization-bindings`, `SplitBrainResolverProvider`, and `enable-http2`. As usual, you add the SBR as the `downing-provide-class`.

Listing 15.9 Cluster local configuration

```
akka {

  actor {                                                                    ❶
    provider = cluster

     serialization-bindings {
      "example.betting.CborSerializable" = jackson-cbor
    }
  }

  remote {                                                                   ❷
    artery {
      canonical.hostname = "127.0.0.1"
      canonical.port = 25525
    }
  }
  cluster {
    seed-nodes = [                                                           ❷
      "akka://betting-house@127.0.0.1:25525]
    downing-provider-class = "akka.cluster.sbr.SplitBrainResolverProvider"   ❸
  }

  http.server.preview.enable-http2 = on                                      ❸

  persistence {...}                                                          ❹
}
```
