❶ Common to local and Kubernetes configurations

❷ This only appears in local.conf.

❸ Common to local and Kubernetes configurations

❹ Shown in the previous section (ignored here)

Remember that `Commands`, `Events`, and `State` must be `CborSerializable`; otherwise, the events can't be stored in the journal. And if you spin multiple nodes, the commands must be serialized so the entities can communicate. That's why `serialization-bindings` is in the configuration. Setting HTTP/2 to `on` allows you to use reflection, query the list of calls of the gRPC services, and help clients build requests and responses at runtime, as with `grpcurl`.

15.2.3 Cluster Kubernetes

The following configuration has neither `remote.artery` nor `cluster.seed-nodes`. You leave Akka Cluster Bootstrap responsible for resolving the cluster consensus via the Kubernetes API.

Listing 15.10 Cluster configuration for Kubernetes

```
akka {

  actor {...}                                    ❶

  discovery {
    kubernetes-api {
        pod-label-selector = "app=%s"            ❷
    }
  }
  management {
    cluster.bootstrap {
      contact-point-discovery {
        discovery-method = kubernetes-api        ❸
```
