❶ Prompts for the password, which is “betting”

Now you can deploy the Kafka needed for the market projection using Strimzi, (https://strimzi.io/quickstarts), which provides a way to run an Apache Kafka cluster on Kubernetes with two lines of code:

```
kubectl create -f 'https://strimzi.io/install/latest?namespace=akka-
➥cluster' -n akka-cluster                                              ❶
kubectl apply -f https://raw.githubusercontent.com/strimzi/strimzi-kafka-
➥operator/main/examples/kafka/kafka-persistent-single.yaml -n akka-
➥cluster                                                               ❷
```

❶ Installs Strimzi in the Kubernetes cluster

❷ Creates an instance of Kafka

Once the Kafka cluster is in place, you can create the topic for the market projection to write in. Going back to folder betting-house/k8s-deployment, enter the following:

```
kubectl apply -f topic.yml -n akka-cluster
```

With the database set up and Kafka running with the required topic for the market, you can deploy the application. Apply role.yml and then deployment.yml:

```
$ kubectl apply -f role.yml -n akka-cluster
$ kubectl apply -f deployment.yml -n akka-cluster
```

In a couple of minutes, you should have a running application:

```
$ kubectl get deploy -n akka-cluster

NAME                                  READY   STATUS    RESTARTS   AGE
my-deployment-name-849577696c-gtxv7   1/1     Running   0          49s
my-deployment-name-849577696c-mckqg   1/1     Running   0          49s
my-deployment-name-849577696c-zfqw4   1/1     Running   0          49s
```
