16.3.1 Alternative 1: Deciders

You can add a decider to restart or resume the stream. This way, you can keep the stream running while dropping the messages that led to the exceptions:

```
import akka.stream.Supervision
class ExceptionsSpec ... {
  ...

  val decider: Supervision.Decider = {
    case _: ArithmeticException => Supervision.Resume
    case _                      => Supervision.Stop
  }
  ...
}
```

These unprocessable messages are dropped without further notice. To add the decider to the stream, add it as an attribute of the stream:

```
import akka.stream.ActorAttributes

class ExceptionsSpec ... {
  ...

  Source...
  ...
  .withAttributes(ActorAttributes.supervisionStrategy(decider))

  ...
}
```

To test both options of the `decider`, you can raise two different exceptions with the risky handler as follows:

```
class ExceptionsSpec ... {
  ...

  def riskyHandler(elem: Int): Int = {
     if (elem > 2)
       throw new IllegalArgumentException(
```
