16.3.3 divertTo

A common scenario is that depending on an element's content, whether it is valid or not, you send the element to a different Kafka topic. In one of these topics, you keep the successfully processed elements, and in the other, the invalid ones. This can be achieved in several ways, one of which is `divertTo`.

The following is a simplification of the original signature:

```
def divertTo(that: Sink[Out], when: Out => Boolean): Flow[Out].
```

Using the previous example's code, `Out` corresponds to the `Result`. In the following listing, the `Result` is diverted if it is invalid—that is, `.isValid` is false.

Listing 16.7 `divertTo` over `Result`

```
class ExceptionsSpec ... {
  ...

      val sink1 = Sink.foreach { each: Result =>      ❶
        println(
          s"${each.value} has been diverted. Caused by: ${each.message}")
      }

      val sink2 = Sink.foreach { each: Result =>      ❷
        println(s"${each.value} has been successfully processed")
      }

      Source(-1 to 1)
        .map(properHandler)
        .divertTo(sink1, !_.isValid)
        ...                                           ❸
        .to(sink2)
        .run()
  ...
}
```
