`Source.tick` creating `Source[T, Cancellable]`—you get a `Source[T, BoundedSourceQueue[T]]`, so you need the materialization value coming from the `Source.queue`. If you picture all the stages one after the other in a single line, the `Source` is to the left of the `Sink`.

The output of the previous test is as follows. Note that the buffer never fills up:

```
processed 2
processed 4
processed 6
processed 8
processed 10
processed 12
processed 14
processed 16
processed 18
processed 20
```

If you reduce the buffer to `2`, only the first two elements of the previous output are printed. Before the stream starts processing the first element, the buffer becomes full and drops the subsequent elements. Only `1` and `2` are processed.

To be more specific about the strategy for dropping elements, you can pass `OverflowStrategy` to a `SourceQueue` instead of using a `BoundedSourceQueue`. The `OverflowStrategy.dropNew` is the implicit strategy of the `BoundedSourceQueue`. To pass `OverflowStrategy.dropHead`, you can use a `SourceQueue`. There are many other strategies, including `dropNew` and `dropTail`.
