To overflow the buffer with just 10 elements, add `.throttle(elements: Int, per: java.time.Duration)` to the stream. Creating a `SourceQueue` by setting the `OverflowStrategy` and throttling the streams looks like this:

```
class QueueSpec ... {
  ...

  val bufferSize = 4

  val queue: SourceQueue[Int] = Source     ❶
        .queue[Int](
          bufferSize,
          OverflowStrategy.dropHead        ❷
        )
        .throttle(1, 100.millis)           ❸
        .map(x => 2 * x)
        .toMat(Sink.foreach(x => println(s"processed $x")))(Keep.left)
        .run()

  (1 to 10).map(x => queue.offer(x))       ❹
  ...
}
```

❶ SourceQueue instead of BoundedSourceQueue

❷ Strategy when the buffer gets full: drops head elements (oldest)

❸ Added throttle to show the buffer getting full

❹ Adds elements to the queue

The output of is as follows:

```
processed 2
processed 4
processed 14
processed 16
processed 18
processed 20
```
