Appendix A. Setting up

This appendix walks you through installing the tools used to follow some of the examples in this book.

A.1 Installing the JDK

You need a JDK. I recommend installing SDKMAN! and, with it, the JDK. SDKMAN! also facilitates your sbt installation.

A.1.1 Installing SDKMAN!

Go to https://sdkman.io/install, and follow the instructions. If you have Windows, you may prefer to skip this step.

A.1.2 Installing Java

Once SDKMAN! is installed, you can install Java with the following command:

```
$ sdk install java 11.0.2-open
```

You don't necessarily have to install this particular version. To install another, find the SDK you want to install with `sdk list java` and `sdk install java x.y.z-version`. If you have Windows, you can install the Oracle standard JDK (https://www.oracle.com/java/technologies) or the OpenJDK (https://openjdk.org).
