

Figure B.3 SOA architecture circa 2005 (Source: Open Source SOA by Jeff Davis, Manning, 2009, http://mng.bz/Blwl)

As you can see on the left, it is no coincidence that an ESB is interwoven with an SOA. It comes full circle, like a car, which is a mix of many inventions. An ESB has the idea of EAI as middleware for the enterprise, with the SOA implemented in SOAP and connected to MOM. From the SOA perspective, it would be too limiting to build a services-based system without a message broker. You can look at the interoperability problem through the old lens of EAI, SOA, or ESB. Nowadays, we have moved from SOAP to REST or the shiny gRPC. Queues are everywhere. Maybe Kafka is the new kid on the block. But the problems are still there, and most of the new solutions are not radically new.
