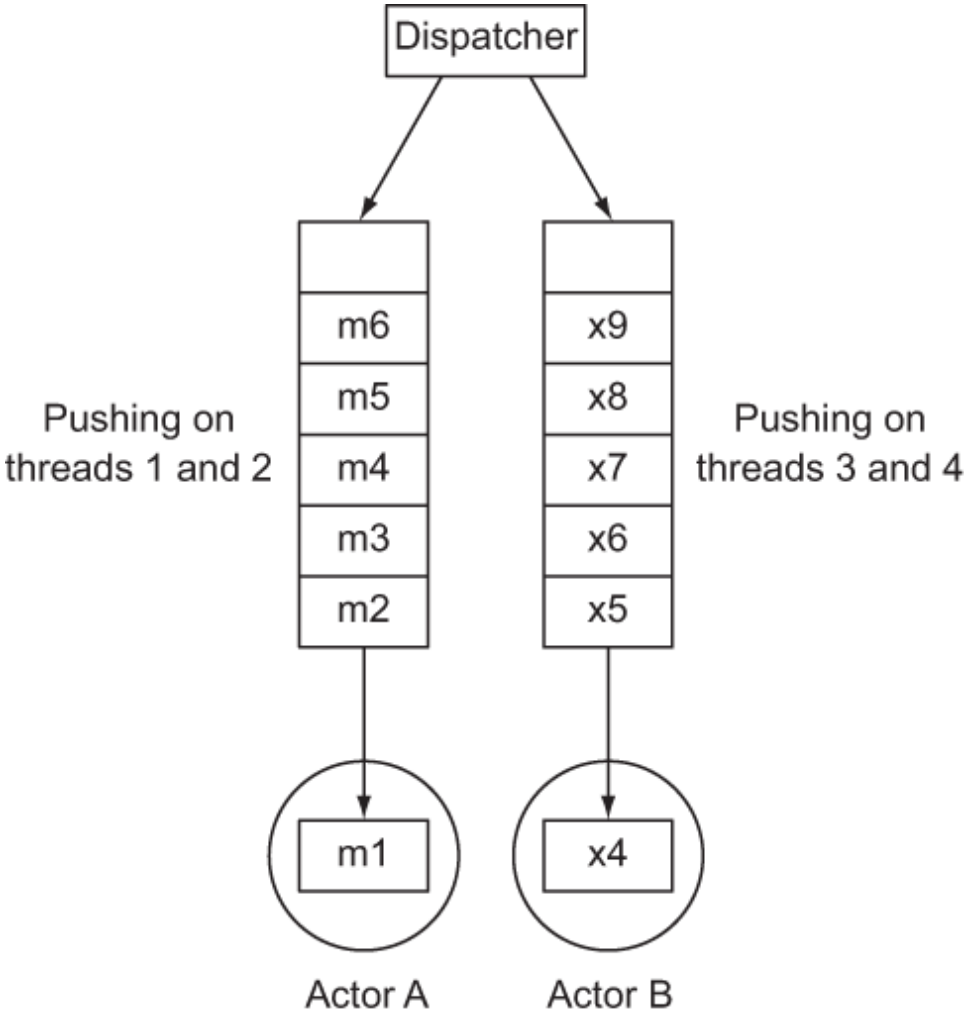

Figure 1.23 Dispatcher pushing messages through multiple actors

Figure 1.23 shows the dispatcher pushing messages m1-m6 on threads 1 and 2 and messages x4-x9 on threads 3 and 4. This figure shouldn't make you think that you can or should control exactly which message will be pushed through on which thread. What's important is that you can configure the threading model quite extensively. All kinds of dispatchers can be configured in some way, and you can allocate a
