- Later, you learn how to store the money in a variable.
- Finally, you deactivate/activate the wallet.

NOTE The source code for this chapter is available at www.manning.com/books/akka-in-action-second-edition or https://github.com/franciscolopezsancho/akka-topics/tree/main/chapter02. You can find the contents of any snippet or listing in the .scala file with the same name as the class or object. For example, you can find the snippet with `object Wallet` in the Wallet .scala file.

2.1 Printing money

In this chapter, you learn how to create an application and an actor and send two messages to the actor that will be output to the console. The following snippet shows the output of such an application: `Wallet$` is the class name of the actor, and the rest is what the actor logs, one line per message sent to the actor (recall that an actor acts as a message queue):

```
[Wallet$] - received ‘1’ dollar(s)
[Wallet$] - received ‘10’ dollar(s)
```

Now let’s get right into the actor and the main class that make up the application.

2.2 Starting to code
